

CBSE Test Paper 01
CH-05 Complex & Quadratic

1. The complex numbers $z = x + iy$; $x, y \in \mathbb{R}$ which satisfy the equation $\left| \frac{z-3i}{z+3} \right| = 1$ lies on
 - a. the y axis
 - b. the x axis
 - c. the line $x + y = 0$
 - d. the line parallel to y axis
2. If $(\sqrt{3} + i)^{10} = a + ib$; $a, b \in \mathbb{R}$, then a and b are respectively :
 - a. 64 and $-64\sqrt{3}$
 - b. 512 and $-512\sqrt{3}$
 - c. 128 and $128\sqrt{3}$
 - d. none of these
3. $z + \bar{z} \neq 0$ if and only if
 - a. $z \neq 0$
 - b. $\operatorname{Re}(z) \neq 0$
 - c. $\operatorname{Im}(z) \neq 0$
 - d. $|z| \neq 0$
4. If $\alpha = \frac{z}{\bar{z}}$, then $|\alpha|$ is equal to :
 - a. -1
 - b. 0

- c. 1
- d. none of these
5. $1 + i^2 + i^4 + i^6 + i^8 + \dots \dots$ up to 1001 terms is equal to
- a. none of these
- b. 0
- c. 1
- d. -1
6. Fill in the blanks:
- The modulus and argument of $z = 1 + i \tan \alpha$ is _____ and _____ respectively.
7. Fill in the blanks:
- The value of $\frac{1}{i^7}$ is _____.
8. Solve $x^2 + 3 = 0$
9. Express the complex numbers $(1 + i) - (-1 + i6)$ in standard form
10. Find the difference of the complex numbers $(6 + 5i), (3 + 2i)$.
11. Express the complex numbers $\left(\frac{1}{5} + \frac{2}{5}i\right) - \left(4 + \frac{5}{2}i\right)$ in standard form
12. Solve: $ix^2 + 4x - 5i = 0$.
13. Find the square root of $1 - i$.
14. If $\operatorname{Re}(z^2) = 0$, $|z| = 2$, then prove that $z = \pm\sqrt{2} \pm i\sqrt{2}$.
15. Find all non-zero complex numbers of z satisfying $\bar{z} = iz^2$.

CBSE Test Paper 01
CH-05 Complex & Quadratic

Solution

1. (c) the line $x + y = 0$

Explanation: Let $z=x+iy$

$$\begin{aligned} \text{Now } \left| \frac{z-3i}{z+3} \right| &= 1 \\ \Rightarrow |z - 3i| &= |z + 3| \\ \Rightarrow |(x + iy) - 3i| &= |x + iy + 3| \\ \Rightarrow |x + i(y - 3)| &= |(x + 3) + iy| \\ \Rightarrow \sqrt{(y - 3)^2 + x^2} &= \sqrt{(x + 3)^2 + (y)^2} \\ \Rightarrow (y - 3)^2 + x^2 &= (x + 3)^2 + (y)^2 \\ \Rightarrow y^2 - 6y + 9 + x^2 &= x^2 + 6x + 9 + y^2 \\ \Rightarrow 6x + 6y &= 0 \\ \Rightarrow x + y &= 0 \end{aligned}$$

2. (b) 512 and $-512\sqrt{3}$

Explanation:

First we will find the polar representation of the complex number $\sqrt{3} + i$

Let $\sqrt{3} + i = r(\cos \theta + i \sin \theta) \Rightarrow r \cos \theta = \sqrt{3} \text{ and } r \sin \theta = 1$

$$\therefore r^2 (\cos^2 \theta + \sin^2 \theta) = 3 + 1 = 4 \Rightarrow r^2 = 4 \Rightarrow r = 2$$

Now $\cos \theta = \frac{\sqrt{3}}{2}$, $\sin \theta = \frac{1}{2}$, both are positive .

So Amplitude $= \theta = \frac{\pi}{6}$

$$\text{Hence } \sqrt{3} + i = 2 \left(\cos \frac{\pi}{6} + i \sin \frac{\pi}{6} \right) = 2e^{\frac{i\pi}{6}}$$

Now,

$$\begin{aligned} (\sqrt{3} + i)^{10} &= \left(2e^{\frac{i\pi}{6}} \right)^{10} = 2^{10} e^{\frac{i5\pi}{3}} = 2^{10} \left(\cos \left(\frac{5\pi}{3} \right) + i \sin \left(\frac{5\pi}{3} \right) \right) \\ &= 2^{10} \left(\cos \left(2\pi - \frac{\pi}{3} \right) + i \sin \left(2\pi - \frac{\pi}{3} \right) \right) = 2^{10} \left(\cos \left(\frac{-\pi}{3} \right) + i \sin \left(\frac{-\pi}{3} \right) \right) \end{aligned}$$

$$= 2^{10} \left(\cos\left(\frac{\pi}{3}\right) - i \sin\left(\frac{\pi}{3}\right) \right) = 2^{10} \left(\frac{1}{2} - i \frac{\sqrt{3}}{2} \right) = 2^{10} \left(\frac{1-\sqrt{3}i}{2} \right) = 2^9 (1 - \sqrt{3}i)$$

Hence $(\sqrt{3} + i)^{10} = a + ib \Rightarrow 2^9 (1 - \sqrt{3}i) = a + ib$

$$\Rightarrow a = 2^9 = 512 \quad \text{and} \quad b = -2^9 \sqrt{3} = -512\sqrt{3}$$

3. (b) $\operatorname{Re}(z) \neq 0$

Explanation: Let $Z=x+iy$ then we have

$$\text{So } Z + \bar{Z} = 2x$$

$$\text{Now } z + \bar{z} \neq 0$$

$$\Leftrightarrow 2x \neq 0$$

$$\Leftrightarrow x \neq 0$$

$$\Leftrightarrow \operatorname{Re}(z) \neq 0$$

4. (c) 1

Explanation:

$$\text{Given } \alpha = \frac{z}{\bar{z}}$$

$$\text{Then } |\alpha| = \left| \frac{z}{\bar{z}} \right| = \frac{|z|}{|\bar{z}|} = 1 \quad \left[\because \left| \frac{z_1}{z_2} \right| = \frac{|z_1|}{|z_2|}, |z| = |\bar{z}| \right]$$

5. (c) 1

Explanation:

$$1 + i^2 + i^4 + i^6 + i^8 + \dots \text{ upto 1001 terms}$$

$$= (i^2)^0 + (i^2)^1 + (i^2)^2 + (i^2)^3 + \dots \text{ upto 1001 terms}$$

$$= (i^2)^0 + (i^2)^1 + (i^2)^2 + (i^2)^3 + \dots + (i^2)^{1000}$$

$$= [(i^2)^0 + (i^2)^1] + [(i^2)^2 + (i^2)^3] + \dots + [(i^2)^{998} + (i^2)^{999}] + [(i^2)^{1000}]$$

$$= [1 - 1] + [1 - 1] + \dots + [1 - 1] + 1$$

$$= 1$$

6. $\sec \alpha, \alpha$

7. i

8. Here $x^2 + 3 = 0 \Rightarrow x^2 = -3 \Rightarrow x = \pm\sqrt{-3} = \pm\sqrt{3}i$

9. $(1 + i) - (-1 + i6)$

$$1 + i + 1 - 6i = 2 - 5i$$

10. $(6 + 5i) - (3 + 2i) = (6 + 5i) + (-3 - 2i)$

$$= (6 - 3) + (5 - 2)i = 3 + 3i$$

11. $\left(\frac{1}{5} + \frac{2}{5}i\right) - \left(4 + \frac{5}{2}i\right)$
 $= \frac{1}{5} + \frac{2}{5}i - 4 - \frac{5}{2}i$
 $= \left(\frac{1}{5} - 4\right) + \left(\frac{2}{5} - \frac{5}{2}\right)i$
 $= \frac{-19}{5} - \frac{21}{10}i$

12. We have, $ix^2 + 4x - 5i = 0 \dots(i)$

On comparing Eq. (i) with $ax^2 + bx + c = 0$, we get

$$a = i, b = 4 \text{ and } c = -5i$$

$$\begin{aligned} \therefore x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ \therefore x &= \frac{-4 \pm \sqrt{(4)^2 - 4 \times i(-5i)}}{2 \times i} \\ &= \frac{-4 \pm \sqrt{16 + 20i^2}}{2i} \\ &= \frac{-4 \pm \sqrt{16 - 20}}{2i} \quad [\because i^2 = -1] \\ &= \frac{-4 \pm \sqrt{-4}}{2i} = \frac{-4 \pm 2i}{2i} \\ &= \frac{4i^2 \pm 2i}{2i} = 2i \pm 1 \quad [\because -1 = i^2] \\ \therefore x &= 2i + 1 \text{ and } x = 2i - 1 \end{aligned}$$

Hence, the roots of the given equation are $2i + 1$ and $2i - 1$.

13. Let $x + yi = \sqrt{1 - i}$

Squaring both sides, we get

$$x^2 - y^2 + 2xyi = 1 - i$$

Equating the real and imaginary parts

$$x^2 - y^2 = 1 \text{ and } 2xy = -1 \dots(i)$$

$$\therefore xy = \frac{-1}{2}$$

Using the identity

$$\begin{aligned}
 (x^2 + y^2)^2 &= (x^2 - y^2)^2 + 4x^2y^2 \\
 &= (1)^2 + 44\left(-\frac{1}{2}\right)^2 \\
 &= 1 + 1 \\
 &= 2
 \end{aligned}$$

$\therefore x^2 + y^2 = \sqrt{2}$ (ii) [Neglecting (-) sign as $x^2 + y^2 > 0$]

Solving (i) and (ii) we get

$$\begin{aligned}
 x^2 &= \frac{\sqrt{2}+1}{2} \text{ and } y = \frac{\sqrt{2}-1}{2} \\
 \therefore x &= \pm \sqrt{\frac{\sqrt{2}+1}{2}} \text{ and } y = \pm \sqrt{\frac{\sqrt{2}-1}{2}}
 \end{aligned}$$

Since the sign of xy is negative.

$$\begin{aligned}
 \therefore \text{if } x &= \sqrt{\frac{\sqrt{2}+1}{2}} \text{ then } y = -\sqrt{\frac{\sqrt{2}-1}{2}} \\
 \text{and if } x &= -\sqrt{\frac{\sqrt{2}+1}{2}} \text{ then } y = \sqrt{\frac{\sqrt{2}-1}{2}} \\
 \therefore \sqrt{1-i} &= \pm \left(\sqrt{\frac{\sqrt{2}+1}{2}} - \sqrt{\frac{\sqrt{2}-1}{2}}i \right)
 \end{aligned}$$

14. Let $z = x + iy$

$$\Rightarrow z^2 = (x + iy)^2 \text{ [squaring both sides]}$$

$$\Rightarrow z^2 = x^2 + i^2 y^2 + 2ixy$$

$$\Rightarrow z^2 = (x^2 - y^2) + i(2xy)$$

$$\therefore \operatorname{Re}(z^2) = 0$$

$$\Rightarrow x^2 - y^2 = 0 \Rightarrow x = \pm y$$

$$\Rightarrow x = y \dots \text{(i)}$$

$$\text{and } x = -y \dots \text{(ii)}$$

$$\text{Again, } |z| = 2 \text{ [given]}$$

$$\Rightarrow |z|^2 = 4$$

$$\Rightarrow x^2 + y^2 = 4 \dots \text{(iii)}$$

From Eqs. (i) and (iii), we get

$$y^2 + y^2 = 4 \Rightarrow 2y^2 = 4$$

$$\Rightarrow y^2 = 2 \Rightarrow y = \pm \sqrt{2}$$

Therefore, from Eq. (i), we get

$$x = \pm \sqrt{2}$$

$$\therefore z = \pm \sqrt{2} \pm i\sqrt{2}$$

On putting the value of x from Eq. (ii) in Eq. (iii), we get

$$(-y)^2 + y^2 = 4 \Rightarrow 2y^2 = 4$$

$$\Rightarrow y^2 = 2 \Rightarrow y = \pm\sqrt{2}$$

From Eq. (ii), $x = \pm\sqrt{2}$

$$\therefore z = x + iy \Rightarrow z = \pm\sqrt{2} \pm i\sqrt{2}$$

Hence proved.

15. Let $z = x + iy$

Given: $\bar{z} = iz^2$

$$\Rightarrow x - iy = i(x^2 - y^2 + 2xy)$$

$$\Rightarrow x - iy = i(x^2 - y^2) - 2xy$$

$$\Rightarrow (x + 2xy) - i(x^2 - y^2 + y) = 0$$

$$\Rightarrow x + 2xy = 0 \dots(i) \text{ and } x^2 - y^2 + y = 0 \dots(ii)$$

Now,

$$x + 2xy = 0 \Rightarrow x(1 + 2y) = 0 \Rightarrow x = 0 \text{ or } 1 + 2y = 0 \Rightarrow x = 0 \text{ or } y = -\frac{1}{2}$$

CASE I: When $x = 0$

Putting $x = 0$ in (ii), we have

$$\Rightarrow -y^2 + y = 0 \Rightarrow y(y - 1) = 0 \Rightarrow y = 0, y = 1$$

Thus, we have the following pairs of values of x and y :

$$x = 0, y = 0; x = 0, y = 1$$

$$\therefore z = 0 + i0 = 0 \text{ and } z = 0 + 1i = i$$

CASE II: When $y = -\frac{1}{2}$

Putting $y = -\frac{1}{2}$ in (ii), we get

$$x^2 - y^2 + y = 0 \Rightarrow x^2 - \frac{1}{4} - \frac{1}{2} = 0 \Rightarrow x^2 - \frac{3}{4} = 0 \Rightarrow x = \pm\frac{\sqrt{3}}{2}$$

Thus, we have the following pairs of values of x and y:

$$x = \frac{\sqrt{3}}{2}, y = -\frac{1}{2} \text{ and } x = -\frac{\sqrt{3}}{2}, y = -\frac{1}{2}$$

$$\therefore z = \frac{\sqrt{3}}{2} - \frac{1}{2}i \text{ and } z = -\frac{\sqrt{3}}{2} - \frac{1}{2}i$$

Hence, all non-zero complex numbers of z are $i, \frac{\sqrt{3}}{2} - \frac{1}{2}i, -\frac{\sqrt{3}}{2} - \frac{1}{2}i$
