## Mathematics

(Chapter - 12) (Introduction to Three Dimensional Geometry) (Class - XI)

## Exercise 12.1

## Question 1:

A point is on the $x$-axis. What are its $y$-coordinates and $z$-coordinates?

## Answer 1:

If a point is on the $x$-axis, then its $y$-coordinates and $z$-coordinates are zero.

## Question 2:

A point is in the XZ-plane. What can you say about its $y$-coordinate?

## Answer 2:

If a point is in the XZ plane, then its $y$-coordinate is zero.

## Question 3:

Name the octants in which the following points lie:
$(1,2,3),(4,-2,3),(4,-2,-5),(4,2,-5),(-4,2,-5),(-4,2,5),(-3,-1,6)$,
(2, -4, -7)

## Answer 3:

The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(1,2,3)$ are all positive. Therefore, this point lies in octant $\mathbf{I}$.
The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(4,-2,3)$ are positive, negative, and positive respectively. Therefore, this point lies in octant IV. The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(4,-2,-5)$ are positive, negative, and negative respectively. Therefore, this point lies in octant VIII. The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(4,2,-5)$ are positive, positive, and negative respectively. Therefore, this point lies in octant $\mathbf{V}$.
The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point ( $-4,2,-5$ ) are negative, positive, and negative respectively. Therefore, this point lies in octant VI.

The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(-4,2,5)$ are negative, positive, and positive respectively. Therefore, this point lies in octant II.

## Vidya Champ

The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point $(-3,-1,6)$ are negative, negative, and positive respectively. Therefore, this point lies in octant III.
The $x$-coordinate, $y$-coordinate, and $z$-coordinate of point (2, $-4,-7$ ) are positive, negative, and negative respectively. Therefore, this point lies in octant VIII.

## Question 4:

Fill in the blanks:
(i) The $x$-axis and $y$-axis taken together determine a plane known as $\qquad$ .
(ii) The coordinates of points in the $X Y$-plane are of the form $\qquad$ .
(iii) Coordinate planes divide the space into $\qquad$ octants.

## Answer 4:

(i) The $x$-axis and $y$-axis taken together determine a plane known as $\mathbf{x y}$ - plane.
(ii) The coordinates of points in the $X Y$-plane are of the form $(\mathbf{x}, \mathbf{v}, \mathbf{0})$.
(iii) Coordinate planes divide the space into eight octants.

# Vidya Champ 

## Mathematics

## (Chapter - 12) (Introduction to Three Dimensional Geometry) (Class - XI)

## Exercise 12.2

## Question 1:

Find the distance between the following pairs of points:
(i) $(2,3,5)$ and $(4,3,1)$
(ii) $(-3,7,2)$ and $(2,4,-1)$
(iii) $(-1,3,-4)$ and $(1,-3,4)$
(iv) $(2,-1,3)$ and ( $-2,1,3$ )

## Answer 1:

The distance between points $P\left(x_{1}, y_{1}, z_{1}\right)$ and $P\left(x_{2}, y_{2}, z_{2}\right)$ is given by

$$
\mathrm{PQ}=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}+\left(z_{2}-z_{1}\right)^{2}}
$$

(i) Distance between points $(2,3,5)$ and $(4,3,1)$
$=\sqrt{(4-2)^{2}+(3-3)^{2}+(1-5)^{2}}$
$=\sqrt{(2)^{2}+(0)^{2}+(-4)^{2}}$
$=\sqrt{4+16}$
$=\sqrt{20}$
$=2 \sqrt{5}$
(ii) Distance between points $(-3,7,2)$ and (2, 4, -1 )
$=\sqrt{(2+3)^{2}+(4-7)^{2}+(-1-2)^{2}}$
$=\sqrt{(5)^{2}+(-3)^{2}+(-3)^{2}}$
$=\sqrt{25+9+9}$
$=\sqrt{43}$
(iii) Distance between points $(-1,3,-4)$ and (1, $-3,4)$
$=\sqrt{(1+1)^{2}+(-3-3)^{2}+(4+4)^{2}}$
$=\sqrt{(2)^{2}+(-6)^{3}+(8)^{2}}$
$=\sqrt{4+36+64}=\sqrt{104}=2 \sqrt{26}$
(iv) Distance between points (2, $-1,3$ ) and ( $-2,1,3$ )

$$
\begin{aligned}
& =\sqrt{(-2-2)^{2}+(1+1)^{2}+(3-3)^{2}} \\
& =\sqrt{(-4)^{2}+(2)^{2}+(0)^{2}} \\
& =\sqrt{16+4} \\
& =\sqrt{20} \\
& =2 \sqrt{5}
\end{aligned}
$$

## Question 2:

Show that the points $(-2,3,5),(1,2,3)$ and $(7,0,-1)$ are collinear.

## Answer 2:

Let points $(-2,3,5),(1,2,3)$, and $(7,0,-1)$ be denoted by $P, Q$, and $R$ respectively. Points $P, Q$, and $R$ are collinear if they lie on a line.

$$
\begin{aligned}
\mathrm{PQ} & =\sqrt{(1+2)^{2}+(2-3)^{2}+(3-5)^{2}} \\
& =\sqrt{(3)^{2}+(-1)^{2}+(-2)^{2}} \\
& =\sqrt{9+1+4} \\
& =\sqrt{14} \\
\mathrm{QR} & =\sqrt{(7-1)^{2}+(0-2)^{2}+(-1-3)^{2}} \\
& =\sqrt{(6)^{2}+(-2)^{2}+(-4)^{2}} \\
& =\sqrt{36+4+16} \\
& =\sqrt{56} \\
& =2 \sqrt{14}
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{PR}= & \sqrt{(7+2)^{2}+(0-3)^{2}+(-1-5)^{2}} \\
& =\sqrt{(9)^{2}+(-3)^{2}+(-6)^{2}} \\
& =\sqrt{81+9+36} \\
& =\sqrt{126} \\
& =3 \sqrt{14}
\end{aligned}
$$

Here, $\mathrm{PQ}+\mathrm{QR}=\sqrt{14}+2 \sqrt{14}=3 \sqrt{14}=P R$
Hence, points $P(-2,3,5), Q(1,2,3)$, and $R(7,0,-1)$ are collinear.

## Question 3:

Verify the following:
(i) $(0,7,-10),(1,6,-6)$ and $(4,9,-6)$ are the vertices of an isosceles triangle.
(ii) $(0,7,10),(-1,6,6)$ and $(-4,9,6)$ are the vertices of a right angled triangle.
(iii) $(-1,2,1),(1,-2,5),(4,-7,8)$ and $(2,-3,4)$ are the vertices of a parallelogram.

## Answer 3:

(i) Let points $(0,7,-10),(1,6,-6)$, and $(4,9,-6)$ be denoted by $A, B$, and $C$ respectively.

$$
\begin{aligned}
\mathrm{AB} & =\sqrt{(1-0)^{2}+(6-7)^{2}+(-6+10)^{2}} \\
& =\sqrt{(1)^{2}+(-1)^{2}+(4)^{2}} \\
& =\sqrt{1+1+16} \\
& =\sqrt{18} \\
& =3 \sqrt{2} \\
\mathrm{BC} & =\sqrt{(4-1)^{2}+(9-6)^{2}+(-6+6)^{2}} \\
& =\sqrt{(3)^{2}+(3)^{2}} \\
& =\sqrt{9+9}=\sqrt{18}=3 \sqrt{2} \\
\mathrm{CA} & =\sqrt{(0-4)^{2}+(7-9)^{2}+(-10+6)^{2}} \\
& =\sqrt{(-4)^{2}+(-2)^{2}+(-4)^{2}} \\
& =\sqrt{16+4+16}=\sqrt{36}=6
\end{aligned}
$$

Here, $A B=B C \neq C A$
Thus, the given points are the vertices of an isosceles triangle.

(ii) Let $(0,7,10),(-1,6,6)$, and $(-4,9,6)$ be denoted by $A, B$, and $C$ respectively.

$$
\begin{aligned}
\mathrm{AB} & =\sqrt{(-1-0)^{2}+(6-7)^{2}+(6-10)^{2}} \\
& =\sqrt{(-1)^{2}+(-1)^{2}+(-4)^{2}} \\
& =\sqrt{1+1+16}=\sqrt{18} \\
& =3 \sqrt{2} \\
\mathrm{BC} & =\sqrt{(-4+1)^{2}+(9-6)^{2}+(6-6)^{2}} \\
& =\sqrt{(-3)^{2}+(3)^{2}+(0)^{2}} \\
& =\sqrt{9+9}=\sqrt{18} \\
& =3 \sqrt{2}
\end{aligned}
$$

$$
\mathrm{CA}=\sqrt{(0+4)^{2}+(7-9)^{2}+(10-6)^{2}}
$$

$$
=\sqrt{(4)^{2}+(-2)^{2}+(4)^{2}}
$$

$$
=\sqrt{16+4+16}
$$

$$
=\sqrt{36}
$$

$$
=6
$$

Now, $\mathrm{AB}^{2}+\mathrm{BC}^{2}=(3 \sqrt{2})^{2}+(3 \sqrt{2})^{2}=18+18=36=\mathrm{AC}^{2}$

Therefore, by Pythagoras theorem, ABC is a right triangle.
Hence, the given points are the vertices of a right-angled triangle.
(iii) Let $(-1,2,1),(1,-2,5),(4,-7,8)$, and $(2,-3,4)$ be denoted by $A, B, C$, and $D$ respectively.

$$
\begin{aligned}
\mathrm{AB} & =\sqrt{(1+1)^{2}+(-2-2)^{2}+(5-1)^{2}} \\
& =\sqrt{4+16+16} \\
& =\sqrt{36} \\
& =6 \\
\mathrm{BC} & =\sqrt{(4-1)^{2}+(-7+2)^{2}+(8-5)^{2}} \\
& =\sqrt{9+25+9}=\sqrt{43} \\
\mathrm{CD} & =\sqrt{(2-4)^{2}+(-3+7)^{2}+(4-8)^{2}} \\
& =\sqrt{4+16+16} \\
& =\sqrt{36} \\
& =6 \\
\mathrm{DA} & =\sqrt{(-1-2)^{2}+(2+3)^{2}+(1-4)^{2}} \\
& =\sqrt{9+25+9}=\sqrt{43}
\end{aligned}
$$

Here, $A B=C D=6, B C=A D=\sqrt{43}$
Hence, the opposite sides of quadrilateral $A B C D$, whose vertices are taken in order, are equal.

Therefore, $A B C D$ is a parallelogram.
Hence, the given points are the vertices of a parallelogram.

## Question 4:

Find the equation of the set of points which are equidistant from the points $(1,2,3)$ and (3, 2, -1).

## Answer 4:

Let $\mathrm{P}(x, y, z)$ be the point that is equidistant from points $\mathrm{A}(1,2,3)$ and $\mathrm{B}(3,2,-1)$. Accordingly, $\mathrm{PA}=\mathrm{PB}$

$$
\begin{aligned}
& \Rightarrow \mathrm{PA}^{2}=\mathrm{PB}^{2} \\
& \Rightarrow(x-1)^{2}+(y-2)^{2}+(z-3)^{2}=(x-3)^{2}+(y-2)^{2}+(z+1)^{2} \\
& \Rightarrow x^{2}-2 x+1+y^{2}-4 y+4+z^{2}-6 z+9=x^{2}-6 x+9+y^{2}-4 y+4+z^{2}+2 z+1
\end{aligned}
$$

$\Rightarrow-2 x-4 y-6 z+14=-6 x-4 y+2 z+14$
$\Rightarrow-2 x-6 z+6 x-2 z=0$
$\Rightarrow 4 x-8 z=0$
$\Rightarrow x-2 z=0$
Thus, the required equation is $x-2 z=0$.

## Question 5:

Find the equation of the set of points $P$, the sum of whose distances from $A(4,0,0)$ and $B(-4,0,0)$ is equal to 10 .

## Answer 5:

Let the coordinates of P be $(x, y, z)$.
The coordinates of points $A$ and $B$ are $(4,0,0)$ and $(-4,0,0)$ respectively. It is given that $P A+P B=10$.

$$
\begin{aligned}
& \Rightarrow \sqrt{(x-4)^{2}+y^{2}+z^{2}}+\sqrt{(x+4)^{2}+y^{2}+z^{2}}=10 \\
& \Rightarrow \sqrt{(x-4)^{2}+y^{2}+z^{2}}=10-\sqrt{(x+4)^{2}+y^{2}+z^{2}}
\end{aligned}
$$

On squaring both sides, we obtain

$$
\begin{aligned}
& \Rightarrow(x-4)^{2}+y^{2}+z^{2}=100-20 \sqrt{(x+4)^{2}+y^{2}+z^{2}}+(x+4)^{2}+y^{2}+z^{2} \\
& \Rightarrow x^{2}-8 x+16+y^{2}+z^{2}=100-20 \sqrt{x^{2}+8 x+16+y^{2}+z^{2}}+x^{2}+8 x+16+y^{2}+z^{2} \\
& \Rightarrow 20 \sqrt{x^{2}+8 x+16+y^{2}+z^{2}}=100+16 x \\
& \Rightarrow 5 \sqrt{x^{2}+8 x+16+y^{2}+z^{2}}=(25+4 x)
\end{aligned}
$$

On squaring both sides again, we obtain
$25\left(x^{2}+8 x+16+y^{2}+z^{2}\right)=625+16 x^{2}+200 x$
$\Rightarrow 25 x^{2}+200 x+400+25 y^{2}+25 z^{2}=625+16 x^{2}+200 x$
$\Rightarrow 9 x^{2}+25 y^{2}+25 z^{2}-225=0$

Thus, the required equation is $9 x^{2}+25 y^{2}+25 z^{2}-225=0$.

## Mathematics

## (Chapter - 12) (Introduction to Three Dimensional Geometry) (Class - XI)

## Exercise 12.3

## Question 1:

Find the coordinates of the point which divides the line segment joining the points $(-2,3$, 5 ) and ( $1,-4,6$ ) in the ratio (i) $2: 3$ internally, (ii) $2: 3$ externally.

## Answer 1:

(i) The coordinates of point R that divides the line segment joining points $\mathrm{P}\left(x_{1}, y_{1}, z_{1}\right)$ and $\mathrm{Q}\left(x_{2}, y_{2}, z_{2}\right)$ internally in the ratio $m$ : $n$ are
$\left(\frac{m x_{2}+n x_{1}}{m+n}, \frac{m y_{2}+n y_{1}}{m+n}, \frac{m z_{2}+n z_{1}}{m+n}\right)$
Let $\mathrm{R}(x, y, z)$ be the point that divides the line segment joining points $(-2,3,5)$ and $(1$, $-4,6$ ) internally in the ratio $2: 3$

$$
\begin{aligned}
& x=\frac{2(1)+3(-2)}{2+3}, y=\frac{2(-4)+3(3)}{2+3} \text {, and } z=\frac{2(6)+3(5)}{2+3} \\
& \text { i.e., } x=\frac{-4}{5}, y=\frac{1}{5} \text {, and } z=\frac{27}{5}
\end{aligned}
$$

Thus, the coordinates of the required point are $\left(-\frac{4}{5}, \frac{1}{5}, \frac{27}{5}\right)$.
(ii) The coordinates of point R that divides the line segment joining points $\mathrm{P}\left(x_{1}, y_{1}, z_{1}\right)$ and $Q\left(x_{2}, y_{2}, z_{2}\right)$ externally in the ratio $m$ : $n$ are
$\left(\frac{m x_{2}-n x_{1}}{m-n}, \frac{m y_{2}-n y_{1}}{m-n}, \frac{m z_{2}-n z_{1}}{m-n}\right)$.
Let $\mathrm{R}(x, y, z)$ be the point that divides the line segment joining points $(-2,3,5)$ and (1, $-4,6$ ) externally in the ratio $2: 3$

$$
x=\frac{2(1)-3(-2)}{2-3}, y=\frac{2(-4)-3(3)}{2-3}, \text { and } z=\frac{2(6)-3(5)}{2-3}
$$

i.e., $x=-8, y=17$, and $z=3$

Thus, the coordinates of the required point are $(-8,17,3)$.

## Question 2:

Given that $P(3,2,-4), Q(5,4,-6)$ and $R(9,8,-10)$ are collinear. Find the ratio in which Q divides PR.

## Answer 2:

Let point $Q(5,4,-6)$ divide the line segment joining points $P(3,2,-4)$ and $R(9,8,-$ $10)$ in the ratio $k: 1$.

Therefore, by section formula,

$$
\begin{aligned}
& (5,4,-6)=\left(\frac{k(9)+3}{k+1}, \frac{k(8)+2}{k+1}, \frac{k(-10)-4}{k+1}\right) \\
& \Rightarrow \frac{9 k+3}{k+1}=5 \\
& \Rightarrow 9 k+3=5 k+5 \\
& \Rightarrow 4 k=2 \\
& \Rightarrow k=\frac{2}{4}=\frac{1}{2}
\end{aligned}
$$

Thus, point $Q$ divides $P R$ in the ratio 1:2.

## Question 3:

Find the ratio in which the YZ-plane divides the line segment formed by joining the points $(-2,4,7)$ and $(3,-5,8)$.

## Answer 3:

Let the $Y Z$ plane divide the line segment joining points $(-2,4,7)$ and $(3,-5,8)$ in the ratio $k: 1$.

Hence, by section formula, the coordinates of point of intersection are given by

$$
\left(\frac{k(3)-2}{k+1}, \frac{k(-5)+4}{k+1}, \frac{k(8)+7}{k+1}\right)
$$

On the $Y Z$ plane, the $x$-coordinate of any point is zero.

$$
\begin{aligned}
& \frac{3 k-2}{k+1}=0 \\
& \Rightarrow 3 k-2=0 \\
& \Rightarrow k=\frac{2}{3}
\end{aligned}
$$

Thus, the YZ plane divides the line segment formed by joining the given points in the ratio 2:3.

## Question 4:

Using section formula, show that the points $A(2,-3,4), B(-1,2,1)$ and $C\left(0, \frac{1}{3}, 2\right)$ are collinear.

## Answer 4:

The given points are $A(2,-3,4), B(-1,2,1)$, and $C\left(0, \frac{1}{3}, 2\right)$.
Let P be a point that divides AB in the ratio $k: 1$.
Hence, by section formula, the coordinates of $P$ are given by
$\left(\frac{k(-1)+2}{k+1}, \frac{k(2)-3}{k+1}, \frac{k(1)+4}{k+1}\right)$
Now, we find the value of $k$ at which point $P$ coincides with point $C$.
By taking $\frac{-k+2}{k+1}=0 \quad$, we obtain $k=2$.
For $k=2$, the coordinates of point P are $\left(0, \frac{1}{3}, 2\right)$.
i.e., $C\left(0, \frac{1}{3}, 2\right)$ is a point that divides $A B$ externally in the ratio $2: 1$ and is the same as point P.

Hence, points $A, B$, and $C$ are collinear.

## Question 5:

Find the coordinates of the points which trisect the line segment joining the points $P(4$, $2,-6)$ and $Q(10,-16,6)$.

## Answer 5:

Let $A$ and $B$ be the points that trisect the line segment joining points $P(4,2,-6)$ and $Q$ $(10,-16,6)$

Point $A$ divides $P Q$ in the ratio 1:2. Therefore, by section formula, the coordinates of point $A$ are given by

$$
\left(\frac{1(10)+2(4)}{1+2}, \frac{1(-16)+2(2)}{1+2}, \frac{1(6)+2(-6)}{1+2}\right)=(6,-4,-2)
$$

## Vidya Champ

Point $B$ divides PQ in the ratio 2:1. Therefore, by section formula, the coordinates of point $B$ are given by

$$
\left(\frac{2(10)+1(4)}{2+1}, \frac{2(-16)+1(2)}{2+1}, \frac{2(6)-1(6)}{2+1}\right)=(8,-10,2)
$$

Thus, $(6,-4,-2)$ and $(8,-10,2)$ are the points that trisect the line segment joining points $P(4,2,-6)$ and $Q(10,-16,6)$.

## Mathematics

## (Chapter - 12) (Introduction to Three Dimensional Geometry) <br> (Class - XI)

## Miscellaneous Exercise on Chapter 12

## Question 1:

Three vertices of a parallelogram ABCD are $\mathrm{A}(3,-1,2), \mathrm{B}(1,2,-4)$ and $\mathrm{C}(-1,1,2)$. Find the coordinates of the fourth vertex.

## Answer 1:

The three vertices of a parallelogram ABCD are given as $\mathrm{A}(3,-1,2), \mathrm{B}(1,2,-4)$, and C $(-1,1,2)$. Let the coordinates of the fourth vertex be $\mathrm{D}(x, y, z)$.

We know that the diagonals of a parallelogram bisect each other.
Therefore, in parallelogram ABCD, AC and BD bisect each other.
$\therefore$ Mid-point of $A C=$ Mid-point of $B D$
$\Rightarrow\left(\frac{3-1}{2}, \frac{-1+1}{2}, \frac{2+2}{2}\right)=\left(\frac{x+1}{2}, \frac{y+2}{2}, \frac{z-4}{2}\right)$
$\Rightarrow(1,0,2)=\left(\frac{x+1}{2}, \frac{y+2}{2}, \frac{z-4}{2}\right)$
$\Rightarrow \frac{x+1}{2}=1, \frac{y+2}{2}=0$, and $\frac{z-4}{2}=2$
$\Rightarrow x=1, y=-2$, and $z=8$
Thus, the coordinates of the fourth vertex are ( $1,-2,8$ ).

## Question 2:

Find the lengths of the medians of the triangle with vertices $A(0,0,6), B(0,4,0)$ and $(6,0,0)$.

## Answer 2:

Let $A D, B E$, and $C F$ be the medians of the given triangle $A B C$.

Since $A D$ is the median, $D$ is the mid-point of $B C$.
$\therefore$ Coordinates of point $D=\left(\frac{0+6}{2}, \frac{4+0}{2}, \frac{0+0}{2}\right)=(3,2,0)$
$\mathrm{AD}=\sqrt{(0-3)^{2}+(0-2)^{2}+(6-0)^{2}}=\sqrt{9+4+36}=\sqrt{49}=7$
Since BE is the median, E is the mid-point of AC.
$\therefore$ Coordinates of point $\mathrm{E}=\left(\frac{0+6}{2}, \frac{0+0}{2}, \frac{6+0}{2}\right)=(3,0,3)$

$$
\mathrm{BE}=\sqrt{(3-0)^{2}+(0-4)^{2}+(3-0)^{2}}=\sqrt{9+16+9}=\sqrt{34}
$$

Since CF is the median, $F$ is the mid-point of $A B$.
$\therefore$ Coordinates of point $\mathrm{F}=\left(\frac{0+0}{2}, \frac{0+4}{2}, \frac{6+0}{2}\right)=(0,2,3)$
Length of $\mathrm{CF}=\sqrt{(6-0)^{2}+(0-2)^{2}+(0-3)^{2}}=\sqrt{36+4+9}=\sqrt{49}=7$
Thus, the lengths of the medians of $\triangle A B C$ are $7, \sqrt{34}$, and 7 .

## Question 3:

If the origin is the centroid of the triangle PQR with vertices $P(2 a, 2,6), Q(-4,3 b,-$ $10)$ and $R(8,14,2 c)$, then find the values of $a, b$ and $c$.

## Answer 3:

It is known that the coordinates of the centroid of the triangle, whose vertices are ( $x_{1}$, $\left.y_{1}, z_{1}\right),\left(x_{2}, y_{2}, z_{2}\right)$ and $\left(x_{3}, y_{3}, z_{3}\right)$, are $\left(\frac{x_{1}+x_{2}+x_{3}}{3}, \frac{y_{1}+y_{2}+y_{3}}{3}, \frac{z_{1}+z_{2}+z_{3}}{3}\right)$

Therefore, coordinates of the centroid of $\triangle P Q R$

$$
=\left(\frac{2 a-4+8}{3}, \frac{2+3 b+14}{3}, \frac{6-10+2 c}{3}\right)=\left(\frac{2 a+4}{3}, \frac{3 b+16}{3}, \frac{2 c-4}{3}\right)
$$

It is given that origin is the centroid of $\triangle P Q R$.

$$
\begin{aligned}
& \therefore(0,0,0)=\left(\frac{2 a+4}{3}, \frac{3 b+16}{3}, \frac{2 c-4}{3}\right) \\
& \Rightarrow \frac{2 a+4}{3}=0, \frac{3 b+16}{3}=0 \text { and } \frac{2 c-4}{3}=0 \\
& \Rightarrow a=-2, b=-\frac{16}{3} \text { and } c=2
\end{aligned}
$$

Thus, the respective values of $a, b$, and $c$ are $-2,-\frac{16}{3}$, and 2 .

# Vidya Champ 

## Question 4:

Find the coordinates of a point on $y$-axis which are at a distance of $5 \sqrt{2}$ from the point $P$ $(3,-2,5)$.

## Answer 4:

If a point is on the $y$-axis, then $x$-coordinate and the $z$-coordinate of the point are zero. Let $A(0, b, 0)$ be the point on the $y$-axis at a distance of $5 \sqrt{2}$ from point $P(3,-2,5)$.
Accordingly, AP $=5 \sqrt{2}$

$$
\begin{aligned}
& \therefore \mathrm{AP}^{2}=50 \\
& \Rightarrow(3-0)^{2}+(-2-b)^{2}+(5-0)^{2}=50 \\
& \Rightarrow 9+4+b^{2}+4 b+25=50 \\
& \Rightarrow b^{2}+4 b-12=0 \\
& \Rightarrow b^{2}+6 b-2 b-12=0 \\
& \Rightarrow(b+6)(b-2)=0 \\
& \Rightarrow b=-6 \text { or } 2
\end{aligned}
$$

Thus, the coordinates of the required points are $(0,2,0)$ and $(0,-6,0)$.

## Question 5:

A point $R$ with $x$-coordinate 4 lies on the line segment joining the points $P(2,-3,4)$ and $Q(8,0,10)$. Find the coordinates of the point $R$.
[Hint suppose R divides PQ in the ratio $k$ : 1 . The coordinates of the point R are given by

$$
\left.\left(\frac{8 k+2}{k+1}, \frac{-3}{k+1}, \frac{10 k+4}{k+1}\right)\right]
$$

## Answer 5:

The coordinates of points $P$ and $Q$ are given as $P(2,-3,4)$ and $Q(8,0,10)$. Let R divide line segment PQ in the ratio $k: 1$.

Hence, by section formula, the coordinates of point $R$ are given by

$$
\left(\frac{k(8)+2}{k+1}, \frac{k(0)-3}{k+1}, \frac{k(10)+4}{k+1}\right)=\left(\frac{8 k+2}{k+1}, \frac{-3}{k+1}, \frac{10 k+4}{k+1}\right)
$$

It is given that the $x$-coordinate of point R is 4 .
$\therefore \frac{8 k+2}{k+1}=4$
$\Rightarrow 8 k+2=4 k+4$
$\Rightarrow 4 k=2$
$\Rightarrow k=\frac{1}{2}$
Therefore, the coordinates of point $R$ are

$$
\left(4, \frac{-3}{\frac{1}{2}+1}, \frac{10\left(\frac{1}{2}\right)+4}{\frac{1}{2}+1}\right)=(4,-2,6)
$$

## Question 6:

If $A$ and $B$ be the points $(3,4,5)$ and $(-1,3,-7)$, respectively, find the equation of the set of points P such that $\mathrm{PA}^{2}+\mathrm{PB}^{2}=k^{2}$, where $k$ is a constant.

## Answer 6:

The coordinates of points $A$ and $B$ are given as $(3,4,5)$ and $(-1,3,-7)$ respectively. Let the coordinates of point P be $(x, y, z)$.
On using distance formula, we obtain

$$
\begin{aligned}
\mathrm{PA}^{2} & =(x-3)^{2}+(y-4)^{2}+(z-5)^{2} \\
& =x^{2}+9-6 x+y^{2}+16-8 y+z^{2}+25-10 z \\
& =x^{2}-6 x+y^{2}-8 y+z^{2}-10 z+50 \\
\mathrm{~PB}^{2} & =(x+1)^{2}+(y-3)^{2}+(z+7)^{2} \\
& =x^{2}+2 x+y^{2}-6 y+z^{2}+14 z+59
\end{aligned}
$$

Now, if $\mathrm{PA}^{2}+\mathrm{PB}^{2}=k^{2}$, then
$\left(x^{2}-6 x+y^{2}-8 y+z^{2}-10 z+50\right)+\left(x^{2}+2 x+y^{2}-6 y+z^{2}+14 z+59\right)=k^{2}$
$\Rightarrow 2 x^{2}+2 y^{2}+2 z^{2}-4 x-14 y+4 z+109=k^{2}$
$\Rightarrow 2\left(x^{2}+y^{2}+z^{2}-2 x-7 y+2 z\right)=k^{2}-109$
$\Rightarrow x^{2}+y^{2}+z^{2}-2 x-7 y+2 z=\frac{k^{2}-109}{2}$

Thus, the required equation is $x^{2}+y^{2}+z^{2}-2 x-7 y+2 z=\frac{k^{2}-109}{2}$
