CHAPTER-13 FUN WITH MAGNETS

Exercises

Question 1:

Fill in the blanks in the following

- (i) Artificial magnets are made in different shapes such as _____, _____ and _____.
- (ii) The Materials which are attracted towards a magnet are called _____.
- (iii) Paper is not a _____ material.
- (iv) In olden days, sailors used to find direction by suspending a piece of _____.
- (v) A magnet always has _____ poles.

Answer 1:

- (i) Artificial magnets are made in different shapes such as **bar-magnet, cylindrical magnet** and **horse-shoe magnet**.
- (ii) The Materials which are attracted towards a magnet are called **magnetic material**.
- (iii) Paper is not a **magnetic** material.
- (iv) In olden days, sailors used to find direction by suspending a piece of **bar-magnet**.
- (v) A magnet always has **two** poles.

Question 2:

State whether the following statements are true or false

- (i) A cylindrical magnet has only one pole.
- (ii) Artificial magnets were discovered in Greece.
- (iii) Similar poles of a magnet repel each other.
- (iv) Maximum iron filings stick in the middle of a bar magnet when it is brought near them.
- (v) Bar magnets always point towards North-South direction.
- (vi) A compass can be used to find East-West direction at any place.
- (vii) Rubber is a magnetic material.

Answer 2:

- (i) A cylindrical magnet has only one pole. **(False)**
- (ii) Artificial magnets were discovered in Greece. **(False)**
- (iii) Similar poles of a magnet repel each other. **(True)**
- (iv) Maximum iron filings stick in the middle of a bar magnet when it is brought near them. **(False)**
- (v) Bar magnets always point towards North-South direction. **(True)**
- (vi) A compass can be used to find East-West direction at any place. **(True)**
- (vii) Rubber is a magnetic material. **(False)**

Question 3:

It was observed that a pencil sharpener gets attracted by both the poles of a magnet although its body is made of plastic. Name a material that might have been used to make some part of it.

Answer 3:

There is a blade in pencil sharpener which is made up of iron. Iron is a magnetic material that is why it is attracted by the poles of magnet.

Question 4:

Column I shows different positions in which one pole of a magnet is placed near that of the other. Column II indicates the resulting action between them for each situation. Fill in the blanks.

Column I	Column II
N - N	_____
N - _____	Attraction
S - N	_____
_____ - S	Repulstion

Answer 4:

Column I	Column II
N - N	<u>Repulsion</u>
N - <u>S</u>	Attraction
S - N	<u>Attraction</u>
<u>S</u> - S	Repulstion

Question 5:

Write any two properties of a magnet.

Answer 5:

- Opposite poles of two magnet attract each other while like poles of two magnet repel each other.
- A freely suspended magnet always aligns in N-S direction.

Question 6:

Where are poles of a bar magnet located?

Answer 6:

The poles of bar magnet are located at its two end points.

Question 7:

A bar magnet has no markings to indicate its poles. How would you find out near which end is its north pole located?

Answer 7:

Hang up the magnet by a light thread so that it hangs freely. When it comes to rest, we notice that the magnet is lying in a North - South direction.

Question 8:

You are given an iron strip. How will you make it into a magnet?

Answer 8:

- Take a rectangular piece of iron bar.
- Take a bar magnet and keep in contact with one of its poles with one edge of the bar of iron.
- Without lifting the bar magnet, move it along the length of the iron bar till you reach the other end.
- Lift the magnet and bring the pole (the same pole you started with) to the same point of the iron bar from which you began

- Move the magnet again along the iron bar in the same direction as you did before. Repeat this process about 30-40 times.
- Bring few all pins near to the iron bar and check if it is converted to a magnet or not.

Making your own magnet

Question 9:

How is a compass used to find directions?

Answer 9:

A compass is usually a small box with a glass cover on it. A magnetised needle is pivoted inside the box, which can rotate freely. The compass also has a dial with directions marked on it.

The compass is kept at the place where we wish to know the directions. Its needle indicates the north-south direction when it comes to rest. The compass is then rotated until the north and south marked on the dial are at the two ends of the needle. To identify the north-pole of the magnetic needle, it is usually painted in a different colour.

Compass
